

Population pharmacokinetics of Testdrug

Methods: A nonlinear mixed-effects model was fitted with NONMEM FOCEI.

A two-compartment oral model with first-order absorption was selected.

CL = 5 L/h; V1 = 20 L; Q = 3 L/h; V2 = 40 L; KA = 1.2 1/h.

Interindividual variance: OMEGA(CL)=0.09 and OMEGA(V1)=0.16.

Residual variability used proportional SIGMA=0.04.

Body weight affected clearance using $(WT/70)^{0.75}$.
